AB The diphenyl e	other herbicide acifluorfen has been shown to act
by inhibition	of the terminal enzyme of the protoporphyrin
biosynthetic p	bathway, protoporphyrinogen oxidase (E.C.
1.3.3.4) (PPO)	, in plant and animal cells. In the present study we show n maintenance of murine erythroleukemia (MEL) cells in
that long term	which is normally toxic to these cells at 5 microM
concentration.	, results in cells that grow at a near normal rate in 100
microM aciflux	orfen Acifluorfen resistant cells do not have
increased leve	als of PPO activity, nor does the PPO made by these cells
have increased	resistance to acifluorfenin, but these cells
accumulate por	rphyrin and have elevated levels of heme. Data is presented the resistance of these MEL cells to acifluorfen
that suggests	table to induction of a cytochrome P450(s).

FILE SEGMENT: LANGUAGE:	English
AB Greenhouse-gr	own sovbean cultivars varied in their tolerance to
preemergence	application of sulfentrazone. The cultivars Ransom,
Hutcheson, Ka	to, Gasoy 17, and Cobb exhibited relatively low
tolerance to	0.5 kg ai ha-1 sulfentrazone with 38, 41, 46, 50, and duction compared to respective controls. The growth of
tolerant cult	ivars Centennial, Edison, and Hartz 5164 was not
afforted by t	his treatment. However, the growth of all cultivars was
reduced at th	e excessive rate of 2.0 kg ha-1 preemergence application of
sulfentrazone	No differences in root uptake or translocation of [14C]
sulfentrazone	were observed between the relatively tolerant and
less tolerant	cultivars tested. Centennial and Hutcheson bidly metabolized sulfentrazone via oxidative degradation of
the 3-methyl	group on the triazolinone ring of the herbicide .
Only 47 and	4.9% of the active ingredient remained in the follage OI
Hutcheson and	Centennial 24 h after treatment, respectively. While there
vore no diffe	prences in Protox inhibition or Proto IX
accumulation	between the two cultivars, Hutcheson was more sensitive than
Centennial to	peroxidative stresses induced by either Proto IX or rose bengal. Therefore, tolerance to
cul fent razone	is due to rapid metabolism of the herbicide ;
however, the	intraspecific difference in response to sulfentrazone appears
to be due to	intrinsic differential tolerance to the
herbicide-inc	duced peroxidative stress.

LANGUAGE :	English
AB The biochemical and	physiological effects of 10 isoxazoles were
investigated. The a	amount of protoporphyrin IX caused to accumulate by the
compounds correlate	ed well with their herbicidal activity.
Protoporphyrinogen	oxidase (Protox) was ively in the proximity of the catalytic site.
innibited competit.	κ 150 values of the methyl esters and acid
chloride derivative	es were lower than expected on the basis of their in
vivo herbicidal ac	tivity. The results suggest that some
tolerance mechanis	n, other than differential absorption and
translocation, may	protect the plants against these compounds. The
molecular properti	es of 9 isoxazoles and 2 other well-known
inhibitors of diff	erent herbicide groups were compared orphyrinogen (Protogen). The most active compounds have
to those of protop	tronic, and energy properties that approximate half of
the Protogen molec	ule. Furthermore, these compounds have atoms/groups on
the ring that gene	rate distinct negative electrostatic potential fields
that may mimic the	reactive part of the Protogen molecule.

English LANGUAGE: Herbicidal damage by photobleaching diphenylether AB herbicides is the indirect result of inhibition of an enzyme in chlorophyll biosynthesis. The substrate of the inhibited enzyme, protoporphyrinogen, accumulates and is subsequently converted to protoporphyrin, a potent photoactive compound which causes light-dependent membrane damage. In the present study, we report characteristics of a factor in the soluble fraction of leaves which can decompose protoporphyrinogen to nonporphyrin products. This process may be important in protecting plants from herbicide damage, since it would interfere with accumulation of the phototoxic porphyrin, protoporphyrin. We found that this protoporphyrinogen destruction is associated with the protein fraction of the soluble leaf homogenate, suggesting its enzymatic nature. Protoporphyrinogen destruction is stable to mild heat, but is eliminated by boiling. Protoporphyrinogen destruction is present in the soluble leaf homogenate but is not localized within the stromal fraction of the chloroplast. The reductants dithiothreitol and betamercaptoethanol, but not glutathione, inhibit protoporphyrinogen destruction at high concentrations. In contrast, ascorbic acid markedly inhibits destruction even at low concentrations, suggesting a role for cellular ascorbic acid in protecting protoporphyrinogen from destruction, thereby enhancing herbicide action. Protoporphyrinogen destruction was least active in young cucumber leaves, a plant highly susceptible to herbicides. Higher levels of protoporphyrinogen destruction were found in leaves of broadleaf mustard and radish, two plants exhibiting herbicide tolerance. For cucumber, the extent of destruction increased with the age of the plant. These findings suggest a correlation between increased protoporphyrinogen destruction and herbicide tolerance in some plant species. ANSWER 6 OF 37 AGRICOLA L7 96:36352 AGRICOLA ACCESSION NUMBER: IND20517474 DOCUMENT NUMBER: An endoplasmic reticulum plant enzyme has TITLE: protoporphyrinogen IX oxidase activity. COUNTRY: Florida; United States DOCUMENT TYPE: Article U.S. Imprints not USDA, Experiment or Extension FILE SEGMENT: LANGUAGE: English Protoporphyrinogen IX oxidase is AB inhibited by peroxidizing herbicides, resulting in the accumulation of protoporphyrin IX. The mechanism of protoporphyrin IX formation is unclear. We found a decrease in protoporphyrin IX in intact corn and cucumber etioplasts with increasing herbicide concentrations, which suggests an extraplastidic mechanism may be involved in forming protoporphyrin IX in herbicide-treated plants. Since a microsomal fraction from eticlated corn seedlings showed a substantial protoporphyrinogen IX oxidizing enzyme activity, the endoplasmic reticulum (ER) from this fraction was purified. Apparent Km and Vmax values of the ER enzyme for protoporphyrinogen IX were similar to the values reported for protox from corn thylakoids. The ER enzyme activity, however, was more sensitive to reductants like dithiothreitol than the plastidic enzyme activity and exhibited a higher tolerance toward various peroxidizing herbicides. Accordingly, the ER enzyme may oxidize protoporphyrinogen IX in the presence of herbicide concentrations, which inhibit the plastidic and mitochondrial protoporphyrinogen IX oxidase. Apparently the ER enzyme is instrumental in the phytotoxic accumulation of protoporphyrin IX in herbicide -treated plants. Publisher: Washington, D.C. : American Chemical Society, 1974-CODEN: ACSMC8; ISSN: 0097-6156 In the series analytic: Porphyric pesticides: NOTE: chemistry, toxicology and pharmaceutical applications / edited by S.O. Duke and C.A. Reheiz. Includes references District of Columbia; United States PUB. COUNTRY: DOCUMENT TYPE: Article; Law FILE SEGMENT: U.S. Imprints not USDA, Experiment or Extension LANGUAGE: English AB Tolerance of nine plant species to diphenyl ether (DPE) herbicides oxyfluorfen and chlomethoxyfen were tested in vivo. There was considerable variation in tolerance to the herbicides between the species. Although both herbicides cause photodynamic damage as a result of protoporphyrinogen oxidase (Protox) inhibition, resulting in abnormally high levels of protoporphyrin IX (Proto IX) accumulation, there is little information on the reasons for differential interspecific tolerance to the herbicides. We compare uptake, movement and metabolism, Proto IX accumulation in vivo, Protox inhibition in vitro, and activities of antioxidative systems between the species to investigate the physiological basis of differential tolerance to two diphenyl ethers. Our findings suggest that differential tolerance of the species examined in this study is mainly due to differences in rates of herbicides absorption, Proto IX accumulation, and intrinsic antioxidative activity. ANSWER 10 OF 37 AGRICOLA 1.7 96:30330 AGRICOLA ACCESSION NUMBER: DOCUMENT NUMBER: IND20513492 TITLE: Characterization of a mutant of Chlamydomonas reinhardtii **resistant** to protoporphyrinogen oxidase inhibitors. Duke and C.A. Reheiz. Includes references PUB. COUNTRY: District of Columbia; United States DOCUMENT TYPE: Article; Law FILE SEGMENT: U.S. Imprints not USDA, Experiment or Extension LANGUAGE: English A nuclear mutant of Chlamydomonas reinhardtii (rs-3) is resistant AB to several herbicides which inhibit the enzyme protoporphyrinogen oxidase (Protox) in plants, including S-23142 [N-(4-chloro-2-fluoro-5-propargyloxy)-phenyl-3,4, 5,6-tetrahydrophthalimide], acifluorfenethyl, oxyfluorfen, and oxadiazon. Protox enzyme activity in Percoll-purified chloroplast thylakoids from rs-3 is less sensitive to S-23142 than that from wild type, indicating that the rs-3 mutation either directly or indirectly confers resistance on the enzyme. Genetic analysis of rs-3 showed that resistance results from a single dominant nuclear mutation that maps to linkage group IX, 13.7 and 12.3 map units from sr-1 and pf-16 respectively. Efforts to identify the resistance gene from a cosmic library of rs-3 nuclear DNA by transformation have yielded one S-23142 resistant isolate from the cell wall-less arginine-requiring strain CC-425 (arg-2, cw-15). Since no isolates resistant to S-23142 were seen in control experiments, this suggests that the resistant isolate is a transformant and that the rs-3 gene can be isolated by screening individual cosmic clones by transformation. Duke and C.A. Reheiz. Includes references District of Columbia; United States PUB. COUNTRY: Article; Law DOCUMENT TYPE: U.S. Imprints not USDA, Experiment or Extension FILE SEGMENT: English LANGUAGE: Porphyrin biosynthesis can be manipulated chemically in pests to cause AB accumulation of sufficient photodynamic porphyrin intermediates for pesticidal activity. Chemicals used for this purpose are: delta-aminolevulinic acid (ALA, a porphyrin precursor); protoporphyrinogen oxidase (Protox) inhibitors; and modulators of the heme and chlorophyll biosynthetic pathways such as 2,2'-dipyridyl and 1,10-phenanthroline. A wide array of Protox inhibitors (herbicides) are commercially available, while ALA-based applications are still in the experimental stage. Protox inhibitors cause the accumulation of protoporphyrin IX and other porphyrins in plants via a complex mechanism. No weeds have thus far evolved resistance to herbicides with this mechanism of action. However, some plant species have natural tolerance to such herbicides by a variety of mechanisms. Protox inhibitors are apparently ineffective on insects; however, ALA and modulators of the heme pathway have insecticidal activity. Porphyrinogenic compounds such as ALA have been used or patented for use in photodynamic therapy, and as herbicides. The commercialization of ALA-based photodynamic herbicides will depend, however, on the success of efforts directed at translating successful greenhouse applications to field use. Protox inhibitors have been patented as pharmaceutical for treatment of disorders of the heme pathway. Protox inhibitor herbicides have been found to cause accumulation of certain porphyrins in non-target animals, although porphyria has not been reported. ANSWER 12 OF 37 AGRICOLA 1.7 95:65492 AGRICOLA ACCESSION NUMBER: DOCUMENT NUMBER: IND20484852 Protoporphyrinogen IX-oxidizing activites involved in TITLE: the mode of action of peroxidizing herbicides Lee, H.J.; Duke, S.O. AUTHOR(S): Southern Weed Science Laboratory, ARS, USDA, CORPORATE SOURCE: Stoneville, MS. DNAL (381 J8223) AVAILABILITY: Journal of agricultural and food chemistry, Nov 1994. SOURCE: Vol. 42, No. 11. p. 2610-2618 Publisher: Washington, D.C. : American Chemical Society. CODEN: JAFCAU; ISSN: 0021-8561 Includes references NOTE: District of Columbia; United States PUB. COUNTRY: DOCUMENT TYPE: Article U.S. Imprints not USDA, Experiment or Extension FILE SEGMENT: English LANGUAGE: A plasma membrane (PM)-associated protoporphyrinogen AB oxidase (Protox)-like activity has recently been hypothesized to play a critical role in the oxidation of protoporphyrinogen IX exported by Protox-inhibited plastids to protoporphyrin IX in acifluorfen-methyl-treated plant tissues. **Protox** activities from etioplast and PM fractions from 7-day-old etiolated barley leaves were compared with regard to susceptibility to several Protox-inhibiting herbicides, effects of NADPH, quinones, and chelators, and other biochemical parameters. Etioplast Protox was much more susceptible to the herbicides than was PM Protox, whereas PM activity was much more inhibited by dithiothreitol (DTT). Cross-contamination could account for the relatively small effect of each of these inhibitors on that fraction on which they had little effect. NADPH was inhibitory to etioplast Protox activity; however, no inhibition was observed on PM Protox activity. Quinones such as duroquinone, juglone, or pyrroloquinoline quinone stimulated PM **Protox** activity, whereas lesser or no effects of these quinones were found in etioplasts. The K(m) values for

protoporphyrinogen IX of etioplast and PM **Protox** were 26 and 172 nM, respectively. DTT did not substantially change the K(m) values in either preparation. Diethyldithiocarbamate, a copper chelator, strongly inhibited PM activity, while it had little or no effect on etioplast **Protox**. Hydrogen peroxide stimulated PM **Protox** activity, whereas cyanide ion and catalase inhibited it. There was much less effect of any of these compounds on etioplast **Protox** activity. These data further substantiate that PM **Protox** is different from etioplast **Protox** and that PM **Protox** is **resistant** to diphenyl ether herbicides. Moreover, they suggest that PM **Protox** has characteristics similar to those of a peroxidase.

AB The mechanism of	oxyfluorfen [2-chloro-1-(3-ethoxy-4-nitrophenoxy)-4-

(trifluoromethyl) benzene] tolerance of a selected nonchlorophyllous soybean cell line was investigated. Light was not required for the growth of the oxyfluorfen-tolerant and normal cell lines but was required for the activity of oxyfluorfen. No growth retardation of either cell line by oxyfluorfen was observed under the dark condition. Under light levels higher than 200 microeinsteins m-2 s-2, the growth of normal cells treated with 10(-8) M oxyfluorfen completely stopped; however, no growth retardation of the tolerant cells was observed up to 10(-7) M. Determination of protoporphyrin IX (Proto IX) accumulation indicated that the normal cells accumulated a much higher amount of Proto IX in the presence of 5 X 10(-8) and 5 X 10(-6) M oxyfluorfen. However, its accumulation in the tolerant cells treated with 5 X 10(-8) M was small. Higher levels of Proto IX were also accumulated in treated cells under the light condition than under the dark condition. This indicates that light acts as an enhancer of the accumulation. The determination of protoporphyrinogen oxidase (Protox) levels showed that the I50 values of Protox activity from the normal and tolerant cells were 5 X 10(-10) and 6 X 10(-9) M oxyfluorfen, respectively. Protox sensitivity differed by a factor of 12 between normal and tolerant cells. This differential Protox sensitivity is considered to cause differential levels of Proto IX accumulation. These data suggest that one of the tolerance mechanisms of the oxyfluorfentolerant cells is a decrease in susceptibility of Protox to oxyfluorfen.

ANSWER 14 OF 37 AGRICOLA T.7 ACCESSION NUMBER: 95:472 AGRICOLA DOCUMENT NUMBER: IND20434997 TTTLE Purification and characterization of a protoporphyrinogen-oxidizing enzyme with peroxidase activity and light-dependent herbicide resistance in tobacco cultured cells. Yamato, S.; Katagiri, M.; Ohkawa, H. AUTHOR(S): CORPORATE SOURCE: Kobe University, Kobe, Japan DNAL (SB951.P49) AVAILABILITY: Pesticide biochemistry and physiology, Sept 1994. Vol. SOURCE: 50, No. 1. p. 72-82 Publisher: Orlando, Fla. : Academic Press. CODEN: PCBPBS; ISSN: 0048-3575 Includes references NOTE: PUB. COUNTRY: Florida; United States DOCUMENT TYPE: Article FILE SEGMENT: U.S. Imprints not USDA, Experiment or Extension LANGUAGE: English The activity of protoporphyrinogen-oxidizing enzymes was found not only in . AB crude etioplast and mitochondrial fractions but also in the soluble

fraction of tobacco cell lines. Approximately 90% of the total activity

09/508,418 Search Strategy/Results

was found in the soluble fraction of the SL cell line. A protoporphyrinogen-oxidizing enzyme was purified from the soluble fraction of SL by chromatography on CM-toyopearl, hydroxyapatite, and HA-1000 columns. The purified enzyme has a molecular weight of approximately 48,000 on SDS-polyacrylamide gel electrophoresis. Apparent Km and Vmax values of the purified enzyme for protoporphyrinogen IX were 78.9 micromolar and 1.3 micromoles/mg protein/min, respectively. The purified enzyme utilized uroporphyrinogen I and coproporphyrinogen I as substrates. The protoporphyrinogen-oxidizing activity of the purified enzyme was not inhibited by herbicides that inhibit protoporphyrinogen oxidase. The purified enzyme contained a heme and showed peroxidase activity toward guaiacol and pyrogallol. On the other hand, peroxidases commercially available showed the protoporphyrinogen-oxidizing activity. Based on these results, the soluble protoporphyrinogen-oxidizing enzyme in tobacco cultured cells seemed to be a kind of peroxidase. The soluble protoporphyrinogen-oxidizing enzyme with **herbicide resistance** may play an important role in the oxidation of protoporphyrinogen IX which accumulates out of the site of heme and chlorophyll biosynthesis in the herbicide-treated plants.

AB We have investigate	d the formation of porphyrin intermediates by isolated
	gare) plastids incubated for 40 min with the porphyrin
	evulinate and in the presence and absence of a

diphenylether herbicide that blocks protoporphyrinogen oxidase, the enzyme in chlorophyll and heme synthesis that

oxidizes protoporphyrinogen IX to protoporphyrin IX. In the absence of

herbicide, about 50% of the protoporphyrin IX formed was found in the extraplastidic medium, which was separated from intact plastids by centrifugation at the end of the incubation period. In contrast, uroporphyrinogen, an earlier intermediate, and magnesium protoporphyrin IX, a later intermediate, were located mainly within the plastid. When the incubation was carried out in the presence of a herbicide that inhibits protoporphyrinogen oxidase, protoporphyrin IX formation by the plastids was completely abolished, but large amounts of protoporphyrinogen accumulated in the extraplastidic medium. To detect extraplastidic protoporphyrinogen, it was necessary to first oxidize it to protoporphyrin IX with the use of a herbicide -resistant protoporphyrinogen oxidase enzyme present in Escherichia coli membranes. Protoporphyrinogen is not detected by some commonly used methods for porphyrin analysis unless it is first oxidized to protoporphyrin IX. Protoporphyrin IX and protoporphyrinogen found outside the plastid did not arise from plastid lysis, because the percentage of plastid lysis, measured with a stromal marker enzyme, was far less than the percentage of these porphyrins in the extraplastidic fraction. These findings suggest that of the tetrapyrrolic intermediates synthesized by the plastids, protoporphyrinogen and protoporphyrin IX, are the most likely to be exported from the plastid to the cytoplasm. These results help explain the extraplastidic accumulation of protoporphyrin IX in plants treated with photobleaching herbicides. In addition, these findings suggest that plastids may export protoporphyrinogen or protoporphyrin IX for mitochondrial heme synthesis. ANSWER 17 OF 37 AGRICOLA £.7 94:2452 AGRICOLA ACCESSION NUMBER: DOCUMENT NUMBER: IND20361237 TITLE: Cellular localization of protoporphyrinogen-oxidizing activities of etiolated barley (Hordeum vulgare L.) leaves. Relationship to mechanism of action of protoporphyrinogen oxidaseinhibiting herbicides. Lee, H.J.; Duke, M.V.; Duke, S.O. AUTHOR(S): AVAILABILITY: DNAL (450 P692) Plant physiology, July 1993. Vol. Vol. 102, No. 3. p. SOURCE: 881-889 Publisher: Rockville, MD : American Society of Plant Physiologists, 1926-CODEN: PLPHAY; ISSN: 0032-0889 Includes references NOTE: PUB. COUNTRY: Maryland; United States Article; Conference DOCUMENT TYPE: U.S. Imprints not USDA, Experiment or Extension FILE SEGMENT: LANGUAGE: English Seven-day-old, etiolated barley (Hordeum vulgare L. var Post) leaves were AB fractionated into crude and purified etioplast, microsomal, and plasma membrane (PM) fractions. Protoporphyrinogen oxidase (Protox) specific activities of crude etioplast, purified etioplasts, microsome, and PM fractions were approximately 29, 26, 23, and 12 nmol h-1 mg-1 of protein, respectively. The herbicide acifluorfen-methyl (AFM), at 1 micromolar, inhibited Protox activity from crude etioplasts, purified etioplasts, microsomes, and PM by 58, 59, 23, and 0% in the absence of reductants. Reductants (ascorbate, glutathione [GSH], dithiothreitol [DTT], and NADPH) individually reduced the **Protox** activity of all fractions, except that microsomal Protox activity was slightly stimulated by NADPH. Ascorbate, GSH, or a combination of the two reductants enhanced **Protox inhibition** by AFM, and AFM **inhibition** of Protox was greatest in all fractions with DTT. NADPH enhanced AFM inhibition significantly only in etioplast fractions. Uroporphyrinogen I (Urogen I) and coproporphyrinogen I (Coprogen I) oxidase activities were found in all fractions; however, etioplast fractions had significantly more substrate specificity for protoporphyrinogen IX (Protogen IX) than the other fractions. Urogen I and Coprogen I oxidase activities were unaffected by AFM in all fractions, and 2 millimole DTT almost completely inhibited these activities from all fractions. Diethyldithiocarbamate inhibited PM Protox activity by 62% but had less effect on microsome and little or no effect on etioplast Protox. Juglone and duroquinone stimulated microsomal and PM Protox activity, whereas the lesser effect of these quinones on etioplast Protox activity was judged to be due to PM and/or microsomal contaminants. These data indicate that there are microsomal and PM Protogen IX-oxidizing activities that are not the same as those associated with the etioplast and that these activities are not inhibited in vivo by AFM. In summary, these data support the view that the primary source of high protoporphyrin IX concentrations in AFM-treated plant tissues is from Protogen IX exported by plastids and

oxidized by AFM-resistant extraorganellar oxidases.

oxidized by AFM-res	istant extraorganeriar oxidases.

LANGUAGE:	English say, 11 species were tested for effects of the
herbicide acifluorf	en on porphyrin accumulation in darkness and
subsequent electrol	vte leakage and photobleaching of chlorophyll after
exposure to light.	Protoporphyrin IX (Proto IX) was the only porphyrin lly increased by the herbicide in any of the
species. However, t	here was a wide range in the amount of Proto IX
accumulation caused	by 0.1 millimolar acifluorfen between species. Within
species, there was	a reduced effect of the herbicide in older direct quantitative comparisons between species are
difficult. Neverthe	less. when data from different species and from tissues
of different age wi	thin a species were plotted, there was a curvilinear
relationship betwee	in the amount of Proto IX caused to accumulate during 20 and the amount of electrolyte leakage or chlorophyll
photobleaching caus	sed after 6 and 24 hours of light respectively,
following the dark	period. Herbicidal damage plateaued at about
10 nanomoles of Pro	to IX per gram of fresh weight. Little difference was tro acifluorfen inhibition of
protoporphyrinogen	oxidase (Protox) of plastid
preparations of mus	stard, cucumber, and morning glory, three species with
large differences i bighly tolerant spe	n their susceptibility at the tissue level. Mustard, a ecies, produced little Proto IX in response to
the herbicide , desc	bite having a highly susceptible
Protox. Acifluorfer	n blocked carbon flow from delta-aminolevulinic
acid to protochloro	pphyllide in mustard, indicating that it vivo. Increasing delta-aminolevulinic
acid concentrations	s (33-333 micromolar) supplied to mustard with 0.1
millimolar acifluor	fen increased Proto IX accumulation and
herbicidal activity Proto IX was simila	y, demonstrating that mustard sensitivity to ar to other species. Differential susceptibility to
acifluorfen of the	species examined in this study appears to be due in
large part to diffe	erences in Proto IX accumulation in response to the cases, differences in Proto IX accumulation
appear to be due to	o differences in activity of the porphyrin pathway.

INFO .: KR 1995-34790 19951011 The present invention provides a herbicide-tolerant AB transgenic plant producing Protox (protoporphyrinogen oxidase) which gives the plant a resistance against DPE(diphenylether) -derived herbicide, and a process for prepg. the same. The process for prepg. a herbicide-tolerant transgenic plant comprises the step of culturing plant cells transformed with a recombinant expression vector contg. Protox gene. Transgenic tobacco expressing Bacillus subtilus Protox were prepd. using Agrobacterium tumefaciens contg. plasmid pBP14, which contains the **Protox** gene controlled by the cauliflower mosaic virus 35S promoter. The leaves of these transgenic plants displayed enhanced resistance to decolorization by oxyfluorfen. ANSWER 23 OF 37 CAPLUS COPYRIGHT 2001 ACS L7 ACCESSION NUMBER: 1996:690153 CAPLUS DOCUMENT NUMBER: 126:2992 Protoporphyrinogen destruction Protoporphyrinogen TITLE: destruction by plant extracts and correlation with tolerance to protoporphyrinogen oxidase-inhibiting herbicides Jacobs, Judith M.; Jacobs, Nicholas J.; Duke, Stephen AUTHOR(S): ο. Dep. Microbiol., Dartmouth Med. Sch., Hannover, NH, CORPORATE SOURCE: 003755-3842, USA Pestic. Biochem. Physiol. (1996), 55(1), 77-83 SOURCE: CODEN: PCBPBS; ISSN: 0048-3575 PUBLISHER: Academic DOCUMENT TYPE: Journal LANGUAGE: English Herbicidal damage by photobleaching di-Ph ether AB herbicides is the indirect result of inhibition of an enzyme in chlorophyll biosynthesis. The substrate of the inhibited enzyme, protoporphyrinogen, accumulates and is subsequently converted to protoporphyrin, a potent photoactive compd. which causes light-dependent membrane damage. We report characteristics of a factor in the sol. fraction of leaves which can decomp. protoporphyrinogen to nonporphyrin products. This process may be important in protecting plants from herbicide damage, since it would interfere with accumulation of the phototoxic porphyrin, protoporphyrin. This protoporphyrinogen destruction is assocd. with the protein fraction of the sol. leaf homogenate, suggesting its enzymic nature. Protoporphyrinogen destruction is stable to mild heat, but is eliminated by boiling. Protoporphyrinogen destruction is present in the sol. leaf homogenate but is not localized within the stromal fraction of the chloroplast. The reductants dithiothreitol and .beta .mercaptoethanol, but not glutathione, inhibit protoporphyrinogen destruction at high concns. Ascorbic acid inhibits destruction, even at low concns., suggesting a role for cellular ascorbic acid in protecting protoporphyrinogen from destruction, thereby enhancing herbicide action. Protoporphyrinogen destruction was least active in young cucumber leaves, a plant highly susceptible to herbicides Higher levels of protoporphyrinogen destruction were found in leaves of broadleaf mustard and radish, two plants exhibiting herbicide tolerance. For cucumber, the extent of destruction increased with the age of the plant. These findings suggest a correlation between increased protoporphyrinogen destruction and herbicide tolerance in some plant species. ANSWER 24 OF 37 CAPLUS COPYRIGHT 2001 ACS L7 ACCESSION NUMBER: 1996:265591 CAPLUS DOCUMENT NUMBER: 125:79315 Accumulation of protoporphyrinogen IX induced by TITLE: acifluorfen methyl Sumida, Motoo; Niwata, Shinjiro; Tanaka, Takaharu; AUTHOR(S): Furuno, Tadahide; Nakanishi, Mamoru; Wakabayashi, Ko; Boeger, Peter Inst. Biomed. Res., Suntory Limited, Osaka, 618, Japan Z. Naturforsch., C: Biosci. (1996), 51(3/4), 174-8 CORPORATE SOURCE: SOURCE: CODEN: ZNCBDA; ISSN: 0341-0382 DOCUMENT TYPE: Journal LANGUAGE: English Confocal fluorescence microscopic images were used to investigate the AB accumulation site of protoporphyrin IX (PPIX) within liverwort cells

(Marchantia polymorpha) treated with the peroxidizing **herbicide** acifluorfen Me (AFM). A high level of PPIX accumulation was obsd. in the cells during 12-24 h after the addn. of AFM. The results obtained from

confocal fluorescence microscopic images gave clear evidence that the accumulation of PPIX occurred only in the chloroplasts, but was not obsd. in the cytosol or at the plasma membrane. The presence of PPIX in the chloroplasts strongly suggests that protoporphyrinogen (Protogen) accumulates by inhibition of protoporphyrinogen **oxidase** (**Protox**) which is the target enzyme for peroxidizing **herbicides**. The plastidic occurrence of PPIX provides evidence of either the presence of an addnl. herbicideresistant Protox or of a non-enzymic Protogen-oxidn. system in the Marchantia chloroplast. AB S23142 and acifluorfen-Et (AFE) inhibit protoporphyrinogen oxidase (Protox) and induce accumulation of protoporphyrin IX (Proto IX) which is a strong phytotoxic photosensitizer. A S23142-resistant cell line, YZI-1S, of photomixotrophically cultured tobacco was selected and its resistance mechanism was characterized. While growth rates of wild-type and YZI-1S cells were similar in the absence of the herbicide, S23142 concns. that reduced the chlorophyll contents by 50% were 2 and 250 nM for wild-type and YZI-1S cell lines, resp. The YZI-1S cells also exhibited resistance for other types of Protox inhibiting herbicides (acifluorfenethyl, acifluorfen, bifenox, oxadiazon, chlomethoxynil, nitrofen and chlornitrofen), but were sensitive to atrazine and DCMU, which inhibit photosynthetic electron transport. YZI-1S cells did not accumulate Proto IX, even at 100 nM S23142 in which the wild-type cells accumulated large amts. of Proto IX. Protox isolated from

YZI-1S cells showed a 2-fold higher activity than that of wild-type cells

and also exhibited a 20-fold increase in **tolerance** to S23142. On the other hand, treatment with 1 mM .delta.-Aminolevulinic acid (ALA), a tetrapyrrole precursor, induced photobleaching by accumulation of Proto IX in both YZI-1S and wild-type cells under high light irradn. Thus, the **resistance** of YZI-1S cells to S23142 is due mainly to the increase of **Protox** activity.

LANGUAGE: English AB A review with 21 refs. of the mode of action of N-phenylimide photobleaching herbicides in comparison with di-Ph ether herbicides. These N-phenylimide herbicides as well as di-Ph ether herbicides induce protoporphyrin IX accumulation and inhibit protoporphyrinogen oxidase activity at extremely low concns. in higher plants. The binding of a 14C-labeled N-phenylimide herbicide S-23121 [N-[4-chloro-2-fluoro-5-[(1- methyl-2-propynyl)oxy]phenyl]-3,4,5,6-tetrahydrophthalimide] to the solubilized plastid fractions of greening corn seedlings is competed by the di-Ph ether herbicide acifluorfen-Et, but not by diuron, an inhibitor of photosynthetic electron transport. These results indicate a similar mode of action for both N-phenylimide and di-Ph ether	

ψu

ю

herbicides. In order to investigate the mechanism of photobleaching herbicides at the mol. level, a strain of Chlamydomonas reinhardtii RS-3 resistant to N-phenylimide S-23142 [N-(4-chloro-2-fluoro-5-propargyloxyphenyl)-3,4,5,6tetrahydrophthalimide] was isolated by mutagenesis with N-methyl-N'-nitro-N-nitrosoguanidine. The 90% inhibition concn. of N-phenylimide S-23142 for growth of RS-3 was 100 times higher than that for wild type. Max. accumulation of protoporphyrin IX was reached at 0.03 .mu.M of S-23142 for the wild type and 3 .mu.M for RS-3. RS-3 was resistant to oxadiazon, oxyfluorfen and acifluorfen-Et which had been shown to have the same mechanism of action as N-phenylimide herbicides, but not to paraquat, diuron or fluridone. Genetic anal. of RS-3 strain showed that the resistance results from a dominant mutation (rs-3) in the nuclear genome. The magnesium protoporphyrin IX synthesizing activity from 5-aminolevulinic acid in chloroplast fragments isolated from RS-3 was less sensitive to S-23142 than that from wild type (CC-407). Protoporphyrinogen oxidase activity in Percoll-purified chloroplasts from RS-3 was also less sensitive to S-23142 than that from wild type. Thus, the resistance of RS-3 is specific for photobleaching herbicides, and the mutation is related to protoporphyrinogen oxidase, the primary site of the photobleaching herbicide action. (14C)iprodione-incubated mycelium indicated that neither isolate metabolized the fungicide. **Inhibition** of fungal growth by the decarboximide fungicides iprodione, vinclozolin, and procymidone could be reversed by the inclusion of the free radical scavenger alpha-tocopherol in the medium, suggesting that the mode of action of the dicarboximides is dependent upon free radical formation. However, this effect was also seen with the chemically unrelated fungicides fenpropimorph and propiconazole but not with benomyl. The level of lipid peroxides and the activity of superoxide dismutase were similar in both isolates; however, the **resistant** isolate had a significantly greater activity of catalase. **Resistance** to the dicarboximide fungicide iprodione in B. cinerea is not therefore mediated by differences in the uptake and subsequent metabolism of the fungicide but may be based on altered levels of enzymes responsible for the detoxification of peroxy radicals.

CPI: New proto-porphyrinogen oxidase gene used in production TITLE: of porphyrin - is derived from Arabidopsis thaliana. DERWENT CLASS: C06 D16 (SUMO) SUMITOMO CHEM CO LTD PATENT ASSIGNEE(S): COUNTRY COUNT: 1 PATENT INFORMATION: LA PG WEEK PATENT NO KIND DATE _____ JP 09140381 A 19970603 (199732)* 6 APPLICATION DETAILS: APPLICATION DATE PATENT NO KIND _____ _____ JP 1995-301054 19951120 JP 09140381 A PRIORITY APPLN. INFO: JP 1995-301054 19951120 1997-344895 [32] WPIDS AN JP 09140381 A UPAB: 19970806 AB Proto-porphyrinogen oxidase gene comprises a gene of 1.7 kbp in length derived from Arabidopsis thaliana and having a nucleotide sequence of 5'-GAATCC-3' (recognised by a restriction enzyme EcoRI) located at a site apart by 1.3 kbp from the 5'-terminal. Also claimed are a plasmid

containing the protoporphyrinogen oxidase gene; a

microorganism carrying the plasmid; plant cells carrying the plasmid; and a plant transformed by introducing the **protoporphyrinogen**

oxidase gene into plant cells.

The gene of the invention is obtained by extracting whole RNA from leaves or stems of Arabidopsis thaliana cDNA is synthesised from poly (A) RNA from the RNA to prepare a cDNA library. The cDNA library is amplified and transformed into E. coli. The microorganism is culture din a medium in which only a transformant expressing **protoporphyrinogen oxidase** can survive, and the positive clones are selected to give cDNA for **protoporphyrinogen oxidase**.

USE - The gene is used to produce **protoporphyrinogen oxidase** which is an enzymes participating in production of porphyrin.

ADVANTAGE - By artificially reinforcing porphyrin biosynthesis by means of the gene for **protoporphyrinogen oxidase** involved in biosynthesis of porphyrin, a plant variety having an improved photosynthetic ability and **resistance** to light requiring **herbicides** can be bred to produce larger products. Dwg.0/3

IUBMB Enzyme Nomenclature

http

Recommended name: protoporphyrinogen oxidase

Reaction: protoporphyrinogen-IX + O_2 = protoporphyrin-IX + H_2O

Other name(s): protoporphyrinogenase; protoporphyrinogen IX oxidase

Systematic name: protoporphyrinogen-IX:oxygen oxidoreductase

Comments: Also slowly oxidizes mesoporphyrinogen-IX.
